LinkedIn: <https://www.linkedin.com/in/pruthvi-shrikaanth-ba065b181/>

2nd Year Computing Student with a wide range of experience building full-stack systems, ML-powered tools and scalable user platforms. Special interest in product engineering, optimisation, applied machine learning and tool and system integration.

Education

Imperial College London – BEng Computing (2024 – 2027)

Currently on a 1st. Modules of interest include machine learning and neural networks, computational techniques and optimisation, networks and software engineering.

King Edward VI Camp Hill School for Boys (2017 – 2024)

A Levels – Maths (A*), Further Maths (A*), Physics (A*), Computing (A)

GCSEs – eight 9s, two 8s

Skills

Languages: Python, Kotlin, Java, C, Dart, JavaScript, Haskell, SQL

Tools & Frameworks: Flutter, Firebase, Git, CI/CD, Pytorch

Areas: Full-stack development, Machine Learning, Optimisation, Systems Design

Experience

Imperial College London – City & Guilds College Union

Full Stack CGCU Site Maintainer (2025 – present)

- Maintain and develop union web platform serving 15k+ monthly users across event, election and society operations
 - Built and deployed event-management and registration features used by multiple student societies
 - Reduced operational downtime by rapidly diagnosing and fixing production issues across frontend and backend systems
 - Collaborate with union officers and student teams to deliver technical solutions under tight event deadlines
-

Projects

Braille Reader and Teacher – ICHack 2025 Anthropic Prize Runner-Up

- Built an assistive learning tool converting live camera input into Braille feedback using OCR and Claude API integration
- Developed an interactive frontend enabling visually impaired students to practise and verify Braille responses in real time
- Designed end-to-end inference pipeline from image capture to language-model feedback within hackathon time constraints
- Awarded runner-up for Anthropic track among competing accessibility-focused projects

Social Simulator and Predictor – ICHack 2026

- Developed simulation framework modelling user interaction patterns across configurable social environments
- Built scalable profile-generation and feedback systems to evaluate engagement outcomes under different recommendation strategies
- Applied behavioural modelling techniques to analyse compatibility, retention and interaction quality metrics
- Extended architecture toward potential B2B applications including partnership matching and organisational network analysis

Peripheral Security System

- Engineered full-stack security management platform supporting real-time monitoring of thousands of personnel
- Implemented configurable role-based access policies and multi-channel emergency alert infrastructure
- Designed peer-to-peer distress signalling system to improve response reliability during network disruption scenarios
- Built scalable client-server architecture prioritising low-latency communication and operational resilience
